

To Whom It May Concern,

Jago was a mechanical engineering intern over the summer, working under my management on a wand sprayer for one of our large agricultural UAVs.

Given a verbal concept and an existing product as a reference, he and another intern followed the full engineering process from design to prototype. They developed and tested multiple design concepts, refining them through iteration. Their work included mechanical design, component research and validation, fabrication, electrical schematic design, and wiring, resulting in a complete and functional prototype with all required documentation.

Jago was eager to contribute and made himself useful even outside his primary responsibilities, assisting with various engineering tasks while waiting for parts. His willingness to learn and proactive attitude made him a helpful addition to the team.

I am happy to recommend Jago for future roles in mechanical engineering. Please feel free to email me for more information. After June 2025, I will no longer be available, in which case you can reach out via our general contact.

Best regards,

Lachlan Brewster
